PROFILE

From the moment I produced "Hello World!" in the console of my first program, I figured out software development is my new passion. Since I have started I want to dig deeper and want to know more. I never thought programming is 'just a job'. There is always a new challenge to accomplish and teach me something new to help me develop better program. What started with a simple curiosity became full-fledged passion that only gets more exciting as the time goes by. Books that helped me with the beginning of my journey : "Javascript For Beginners" , "Eloquent Javascript" .

EXPERIENCE

FACE DETECTION APP

Front-End part of future full-stack project.

Written by using '**React.js**'

Most of the styling was done with

'npm tachyons'. Also face-detection-AI API used to recognize faces on photos.

This project is good example of DOM

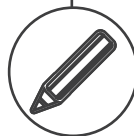

(Document Object Model) manipulation and responsive design.

Source code of this project can be checked in my github repository.

Also some of other little projects I have done since I have started to learn programming can be checked on :
